September 15, 2022

1 ENGN 2770: Atomistic Reaction Engineering

1.1 Computational Tutorial

This is the pdf version. The interactive version (which includes necessary environment files) can be accessed from using the link provided:

https://mybinder.org/v2/gh/bjkreitz/ase-tutorial-engn2770/main

(Note: This can take a minute or two to load and download required environment files)

Once you open the link, you can download the "engn2770_computational_tutorial.ipynb" and save it on your local computer.

Note, you will need jupyter notebook along with other necessary packages if you wish to use it on your local machine(ASE, python, matplotlib, numpy).

1.2 A) Intro to linux bash commands (https://files.fosswire.com/2007/08/fwunixref.pdf)

```
[1]: from IPython.display import Image
```

```
[3]: Image(filename='extras/linux_commands.PNG')
```

[3]:

Job	Command
Identify the directory you are in	**pwd**
List the files in the directory	**ls**
List the files in the directory with hidden files	**ls -a**
Go to your home directory	**cd** or **cd ~/**
Change directory to <directory_name>	**cd** <directory_name>
move one directory up	**cd ..**
Move two directories up	**cd ../../**
Make directory <directory_name>	**mkdir** <directory_name>
copy a file	**cp** </path/to/file/file_name> </new/path/to/file/file_name>
Move a file	**mv** </path/to/file/file_name> </new/path/to/file/file_name>
Remove a file / remove a file recursively (Careful! - No way to revert this!)	**rm** <file_name> / **rm -r** <file_name>
Remove a directory (Careful! - No way to revert this!)	**rm -rf** <directory_name>
Create an empty file	**touch** <file_name>
Display the contents of a file	**cat** <file_name>
Text editors	**nano / vi / vim / gedit**

[4]:
```
Image(filename='extras/ccv_commands.PNG')
```

[4]:

Job	Command
Access Oscar	**ssh <username>@ssh.ccv.brown.edu**
Access Oscar and connect to display port	**ssh -X <username>@ssh.ccv.brown.edu**
Navigate on Oscar	see Linux commands
Copy a file to Oscar	**scp** </path/to/file/file_name> **<username>@ssh.ccv.brown.edu:**</new/path/to/file/file_name>
Copy a directory to Oscar	**scp -r** </path/to/directory_name> **<username>@ssh.ccv.brown.edu:**</new/path/to/directory_name>
Submit a job	**sbatch** <file_name>
Check your queue	**myq**
Cancel a job	**scancel** <job_id>

1.3 B) Python

1.3.1 Basic arithmetic

```python
[4]: # Basic arithmetic
     a = 2.
     b = 3.

     print(a + b)
```

```
5.0
```

```python
[5]: # square of a number
     sq = a**2
     print(sq)
```

```
4.0
```

```python
[6]: # division & %
     print(4./2)

     # remainder of a division
     print(15.%8)
     print(8.%2) # If this is 0, then 8 is divisible by 2!
```

```
2.0
7.0
0.0
```

1.3.2 Functions

```python
[7]: # functions

     # define add function
     def add(a,b):
         return a+b

     # define power function
     def power(a,pow=2):
         return a**pow

     # call add function
     add_result = add(2.,3.)
     print(add_result)

     # call power function
     power_result = power(5.,3)
     print(power_result)
```

```
5.0
125.0
```

```
[8]: sum_result = sum((2.,2.))
     print(sum_result)

     pow_result = pow(5.,4)
     print(pow_result)
```

```
4.0
625.0
```

1.3.3 numpy, list & arrays

```
[9]: # using numpy (Numerical Python)
     import numpy as np

     sum_result = np.sum((2.,-3.))
     print(sum_result)

     power_result = np.power(2.,8)
     print(power_result)
```

```
-1.0
256.0
```

```
[10]: # list
      things = ['a',7]

      for thing in things:
          print(thing)
```

```
a
7
```

```
[11]: # Basic list commands

      _list = [1,2,3,4]

      #_list.append(5)
      #_list.pop(2)
      #_list.reverse()

      print(_list)
```

```
[1, 2, 3, 4]
```

```
[12]: import numpy as np

      # return evenly spaced numbers over a specified interval
```

```
a = np.linspace(1,12,12)
print(a)
print(a.shape)

# convert a 1D array into 2D
a.reshape(3,4)
```

```
[ 1.  2.  3.  4.  5.  6.  7.  8.  9. 10. 11. 12.]
(12,)
```

[12]:
```
array([[ 1.,   2.,   3.,   4.],
       [ 5.,   6.,   7.,   8.],
       [ 9.,  10.,  11.,  12.]])
```

1.3.4   For loop & conditional statements

[13]:
```
# for loops
for element in range(5):
    print(element, element**2)
```

```
0 0
1 1
2 4
3 9
4 16
```

[14]:
```
# For loops with conditional statements

dice = [1,2,3,4,5,6]

type_list = []

for roll in dice:
    if roll % 2 == 0:
        type_list.append('even')
    else:
        type_list.append('odd')

print(type_list)
```

```
['odd', 'even', 'odd', 'even', 'odd', 'even']
```

[15]:
```
num = np.linspace(0,10,11)
print(num)

doubled_list = []
```

```
for element in num:
    if element > 5:
        doubled_list.append(element*2)

print(doubled_list)
```

```
[ 0.  1.  2.  3.  4.  5.  6.  7.  8.  9. 10.]
[12.0, 14.0, 16.0, 18.0, 20.0]
```

[16]:
```
# For loop with conditional statement in one line

num = np.linspace(0,10,11)
print(num)

doubled = [element * 2 for element in num if element>5]
print(doubled)
```

```
[ 0.  1.  2.  3.  4.  5.  6.  7.  8.  9. 10.]
[12.0, 14.0, 16.0, 18.0, 20.0]
```

[17]:
```
long_words = ['platinum', 'hi', 'carbon', 'welcome', 'hydrogen', 'neptune',
 ↪'covid', 'python']

# checks and stores into new list based on length of a word
short_words = [word for word in long_words if len(word) < 6]

short_words
```

[17]:
```
['hi', 'covid']
```

1.4 C) Atomic Simutlation Environment

[18]:
```
# Some basic packages we will need throughout

import os
import numpy as np

import ase
from ase.parallel import paropen
from ase.io import read, write
from ase.visualize import view

# Plotting and image visualizing in Jupyter Notebook
import matplotlib
import matplotlib.pyplot as plt
from IPython.display import Image
```

```
%matplotlib inline
```

2 Module 1: Atom / Atoms

```
[19]: # import the module (use tab tab for auto-completion)
      from ase import Atom, Atoms
```

```
[20]: # use ? to know more
      #atom = Atom?
```

```
[21]: atom = Atom('O')
      atom.mass = 16
      atom.charge = -2
      atom.position = (0,2,3)
      #atom.symbol
      #atom.x
      #atom.y
```

```
[22]: # use ? to know more
      #Atoms?
```

```
[23]: d = 1.104 # N2 bondlength

      # The following three are equivalent
      N2 = Atoms('N2', [(0, 0, 0), (0, 0, d)])
      N2 = Atoms(numbers=[7, 7], positions=[(0, 0, 0), (0, 0, d)])
      N2 = Atoms([Atom('N', (0, 0, 0)), Atom('N', (0, 0, d))])

      # to save and view a snapshot
      write('extras/n2.png', N2, rotation='-80y')
      Image(filename='extras/n2.png')

      # to have a 3D view in notebook
      #view(N2, viewer='x3d')
```

[23]:

```
[24]: d = 2.9
      L = 10.0

      # construct a Au wire
      wire = Atoms('Au',
                   positions=[[0, L / 2., L / 2.]],
```

```
                cell=[d, L, L],
                pbc=[1, 0, 0])

wire.get_chemical_symbols()

# to save and view a snapshot
write('extras/wire.png', wire * (6,1,1))
Image(filename='extras/wire.png')

#view(wire*(6,1,1), viewer='x3d')

#view(wire*(6,1,1))
```
[24]:

3   Module 2: Build (molecule, bulk, surfaces)

[25]:
```
from ase.build import molecule

m = molecule('CH3CH2OH')
print(m.get_chemical_symbols())
print(m.get_chemical_formula())
print(m.get_positions())

# to save and view a snapshot
write('extras/ethanol.png', m, rotation='-20x')
Image(filename='extras/ethanol.png',width=150)

#view(m, viewer='x3d')

#view(m)
```

```
['C', 'C', 'O', 'H', 'H', 'H', 'H', 'H', 'H']
```

```
C2H6O
[[ 1.168181 -0.400382  0.       ]
 [ 0.         0.559462  0.       ]
 [-1.190083 -0.227669  0.       ]
 [-1.946623  0.381525  0.       ]

 [ 2.115891  0.1448    0.       ]
 [ 1.128599 -1.037234  0.885881]
 [ 1.128599 -1.037234 -0.885881]]
```

[25]:

4 Optimize lattice constant

[26]:
```python
from ase.build import bulk
from ase.calculators.emt import EMT
from ase.io import Trajectory

a0 = 3.6
cu = bulk('Cu', 'fcc', a=a0, cubic=True)

print(cu.get_cell())

# to save and view a snapshot
write('extras/cu.png', cu)
Image(filename='extras/cu.png',width=150)

#view(cu, viewer='x3d')

#view(cu)
```
```
Cell([3.6, 3.6, 3.6])
```
[26]:

```python
[27]:  # create an empty list to store energy
       energy_list = []

       # start with a good guess
       # and create a list with fluctuations in a.

       a0 = 3.6
       a_list = a0 + np.linspace(-0.2, 0.2, 101)

       # For loop to use each and every value of a
       # and calculate & store the potential energy

       for a in a_list:
           cu = bulk('Cu', 'fcc', a=a, cubic=True)
           cu.set_calculator(EMT())
           e = cu.get_potential_energy()
           energy_list.append(e)
```
```python
[28]:  # plotting using matplotlib (https://matplotlib.org/)

       fig, ax = plt.subplots(figsize=(7,7))
       plt.scatter(a_list, energy_list, marker='o', s=10)
       plt.xlabel('$a$, $\mathrm{\AA}$', fontsize=15)
       plt.xticks(fontsize=15)
       plt.ylabel('potential enegry, eV', fontsize=15)
       plt.yticks(fontsize=15)
       fig.savefig('extras/lattice_constant.png')
       plt.show()
```

[29]: ```python
index corresponding to the lowest energy

index = energy_list.index(min(energy_list))
lc = a_list[index]
print('lattice constant:%0.3f'%lc)
```

```
lattice constant:3.588
```

5 Module 3: Surface, Constraints

[30]: ```python
from ase.build import fcc111
from ase.constraints import FixAtoms
```

```
[31]: #fcc111?
```

```
[32]: # Create a slab using build
      slab = fcc111('Cu', size=(3,3,3), a=3.588, vacuum=10)
      slab.set_pbc((1,1,0))

      # Use of constraints, here, Fix the bottom most layer
      indices=[atom.index for atom in slab if atom.tag == 3]
      constraint = FixAtoms(indices)
      slab.set_constraint(constraint)

      # Note that the constraint is not visible through
      # the following method

      write('extras/cu_slab.png', slab, rotation='10z,-80x')
      Image(filename='extras/cu_slab.png')

      #view(slab, viewer='x3d')
      #view(slab)
```

[32]:
6 Module 4: Add an adsorbate

method 1

```
[33]: from ase.build import add_adsorbate

      # create a slab
      slab = fcc111('Cu', size=(3,3,3), a=3.588, vacuum=10)
      slab.set_pbc((1,1,0))

      # create an atom and use add_adsorbate to add it to the slab
      adsorbate = Atom('O')
      add_adsorbate(slab, adsorbate, 1.8, 'ontop')

      write('extras/slab_with_adsorbate.png', slab * (2, 2, 1))
      Image(filename='extras/slab_with_adsorbate.png')
```
```
#view(slab, viewer='x3d')
#view(slab)
```

[33]:

method 2

[34]:
```
a = 3.558

# create a slab
slab = fcc111('Cu', size=(3,3,3), a=3.588, vacuum=10)
slab.set_pbc((1,1,0))

# use the slab atom position to add it to the slab
adsorbate = Atom('O')
adsorbate.position = slab[18].position + (0,0,2)

slab_with_add = slab + adsorbate

write('extras/slab_with_adsorbate.png', slab_with_add)
Image(filename='extras/slab_with_adsorbate.png')

#view(slab_with_add, viewer='x3d')
#view(slab_with_add)
```
[34]:

7 Module 5: Structure optimization using EMT

```python
[35]: from ase.constraints import FixAtoms
      from ase.build import fcc111, add_adsorbate
      from ase.calculators.emt import EMT
      from ase.optimize import BFGS

      # Construct a slab with optimized lattice constant
      slab = fcc111('Cu', size=(3,3,3), a=3.588, vacuum=10)
      # Periodic boundary conditions
      slab.set_pbc((1,1,0))

      # Construct & add an adosorbate
      adsorbate = Atom('O')
      add_adsorbate(slab, adsorbate, 1.8, 'ontop')

      # Fix atoms
      indices=[atom.index for atom in slab if atom.tag == 3]
      constraint = FixAtoms(indices)
      slab.set_constraint(constraint)

      # Calculator
      calc = EMT()
      slab.set_calculator(calc)

      if os.path.exists('qn.log'):
          os.remove('qn.log')

      # Optimization
      opt = BFGS(slab, logfile='qn.log', trajectory='qn.traj')
      opt.run(fmax=0.01)
```

```
[35]: True
```

```
[36]: #relaxed_slab = read('qn.traj')
      #view(relaxed_slab)
```

```
[37]: myfile = open("qn.log",'r')
      txt = myfile.read()
      print(txt)
```

```
